## 1. Main downloads

### 1.1. Download framework

This package contains the source, the JAR file and the JavaDoc of the Dimensions framework.

### 1.2. Download simple example

This package contains the source of a simple web application. Just build it and see if it works :-P

Notice that this release is built using the version 0.6.1 of the framework, but the differences between 0.6.1 and 0.6.2 are only on the elegance of the source code.

## 2. Archived downloads

### 2.1. Download version 0.5 of the framework

Dimensions was first released as a pure multi-channel framework, used to deliver different page aspects depending on the calling device. This is the package that you would like to download only for testing. The 0.6 version includes all classes from this version.

### 2.2. Download example

This package contains a complete example of a multi-channel web application. It uses Dimensions 0.5 but is very interesting because it is almost complete.
